

AI Workflow Discovery Studio

Feature overview and reviewer guide for enterprise MVP evaluation

Purpose	A local app for interviewing colleagues about repeatable workflows and packaging practical AI solution handoffs for Product, Engineering, Business, Governance, and enterprise platform review.
----------------	---

Executive Summary

AI Workflow Discovery Studio is a local, browser-based intake and analysis tool. It helps an AI or delivery lead guide a colleague through workflow discovery, then turns the results into reviewable documents, structured data, and connector-readiness artifacts.

The current build is enterprise MVP transfer-ready: it runs locally, exports packages, supports safe sample review, and includes checks that prevent secrets, generated app data, and local machine paths from entering the review ZIP.

What It Can Do

Area	What it does
Discovery	Guided interview for workflow name, start/end, systems, inputs, outputs, and A-to-Z steps.
Analysis Studio	Structured workspace for reviewing readiness, gaps, open questions, and output coverage.
Outputs	Generates Product, Engineering, Business, Governance, Build Recipe, Execution Plan, and Readiness artifacts.
Connector Readiness	Frames Microsoft 365, evidence uploads, approved storage, permissions, pilot data, and fallback mode.
Review Package	Builds a sanitized ZIP for code, logic, and enterprise review without secrets or generated app data.

How It Works

- Start in Discovery and describe a workflow in plain language.
- Capture the workflow frame: name, trigger, end point, business outcome, systems, data, inputs, and outputs.
- Add the rough A-to-Z process, then drill into steps, decisions, exceptions, access, and evidence.
- Review Analysis Studio outputs and open-question routing.
- Export DOCX, Excel, JSON, Markdown, and local ZIP packages for review.

Who Should Review It

Reviewer	What to review
Workflow owners	Can explain a repetitive workflow and confirm if the generated outputs are accurate.
AI builders	Can use the Solution Build Recipe and Execution Plan to plan a ChatGPT/Copilot implementation.
Engineering reviewers	Can inspect systems, data, connector assumptions, output manifest, and package contracts.
Governance / security	Can review data boundary, permission scope, approval gates, fallback mode, and stop criteria.
Pilot leads	Can run safe-sample pilots and decide promote, defer, or block using the decision packet.

Enterprise MVP Posture

The app is ready for controlled work-environment MVP review, not broad production rollout. The recommended first work-computer setting is `ENTERPRISE_MODE=on` and `CONNECTOR_MODE=mock`. Live Microsoft 365 connector access should stay disabled until Entra app registration, Microsoft Graph scopes, data boundary, source owner, and security review are approved.

- Use synthetic or approved internal examples first.
- Keep secrets only in work-machine `.env.local` or approved secret storage.
- Run the package doctor before sharing any ZIP.

Discovery intake workspace

The screenshot displays the 'Discovery' tab of an 'AI online' workspace. The top navigation bar includes 'AI online', 'Discovery', 'Analysis Studio', 'Help', and an 'Export Excel' button. The main interface is divided into two primary sections. On the left, the 'CURRENT QUESTION' is 'Can you give me the rough numbered A-to-Z process from trigger to final output?'. Below this, there are tabs for 'Workshop acceleration', 'Confirmed lens', and 'A-Z process'. A 'Voice idle' indicator and a 'Session 50%' progress bar are at the top of this section. At the bottom of the left section are buttons for 'Dictate', 'Stop', and 'Add Attachment'. On the right, the 'CONVERSATION' section shows a 'Live transcript' with 5 older turns saved. It displays the current question from the AI and the user's typed answer: '1. Receive the partner request and clarify the target outcome. 2. Pull prior decks, reusable templates, and relevant client context from SharePo...'. A 'Show full turn' link is present. At the bottom of the right section is a large text input area with the placeholder 'Type an answer, rough notes, or a numbered workflow...' and an 'Accept & Analyze' button. A 'Capture Feedback' button is located at the very bottom of the interface.

The interview starts with plain-language workflow discovery before drilling into data, access, governance, and build details.

Analysis Studio and output alignment

Analysis Studio turns intake into reviewable Product, Engineering, Business, Governance, and build artifacts.

Template Alignment and provenance

Output fields carry provenance and treatment metadata so reviewers can see what was captured, inferred, missing, or supplement-later.

Testing and release planning

The app separates self testing, colleague pilot, and enterprise release gates.

First Review Script

- Open the app locally at <http://localhost:5177/>.
- Use one scenario from `SAFE_SAMPLE_SCENARIOS.md`.
- Run a short Discovery interview and capture the rough A-to-Z process.
- Open Analysis Studio and review output readiness.
- Download one or more outputs, then create a local handoff package.
- Run `node scripts/check-work-environment-readiness.mjs` and `node scripts/check-review-package.mjs` before sharing.

Current validated package	ai-workflow-discovery-studio-review-0.1.0-2026-06-05T11-50-53-306Z.zip passed full stabilization, clean-install smoke, and package-doctor validation.
